

Project Report

Relief Distribution Management System (RDMS)

1. Executive Summary:

The Relief Distribution Management System (RDMS) is a comprehensive web-based application designed to streamline and automate the operations of charitable organizations, non-governmental organizations (NGOs), and disaster relief agencies. By digitalizing the management of aid, beneficiaries, volunteers, and financial donations, the system ensures transparency, efficiency, and accountability in humanitarian efforts.

2. Project Objectives:

Automate Aid Distribution: Replace manual ledger-based distribution tracking with a digital system to prevent duplicate aid and ensure fair resource allocation.

Enhance Stakeholder Management: Maintain a centralized database of all key participants, including beneficiaries receiving aid, donors providing funds, and volunteers executing field tasks.

Financial Transparency: Accurately track incoming donations and map them to specific relief projects or funds.

Data-Driven Reporting: Generate real-time reports to analyze project success, resource utilization, and overall organizational impact.

3. System Architecture & Technology Stack:

The RDMS follows a traditional multi-tier web application architecture, ensuring a lightweight and

An accessible deployment model suitable for organizations with varying IT infrastructures.

Frontend Presentation Layer: HTML5, CSS3 (including custom styling via style.css), and standard web interfaces.

Backend Logic Layer: PHP handles business logic, session management (auth.php, logout.php), and dynamic content generation.

Data Storage Layer: Relational Database Management System (MySQL/MariaDB) deployed via the rdms_database.sql schema.

4. Core Modules & Functionality

4.1 Aid Distribution Management (aid-distribution.php):

The core of the application. It logs every relief package, financial grant, or medical supply distributed. It tracks the date, the recipient, and the specific project the aid belongs to.

4.2 Stakeholder Tracking:

Beneficiaries (beneficiaries.php): Profiles of aid recipients, including demographics, vulnerability assessments, and history of aid received.

Donors (donors.php): Records of individuals or corporate entities contributing to the NGO.

Volunteers (volunteers.php): Management of the human workforce, tracking availability, skill sets, and project assignments.

4.3 Financial & Operational Control:

Donations (donations.php): A ledger of all financial contributions, mapped to donor profiles and specific funding campaigns.

Projects (projects.php): Allows administrators to create and manage specific relief campaigns (e.g., "Flood Relief 2024" or "Winter Blanket Drive").

Reports (reports.php): Analytical module to generate summaries and operational insights for board members and auditors.

5. Conclusion:

The implementation of the Relief Distribution Management System provides a critical technological

upgrade for relief organizations. By transitioning from fragmented physical records to a unified PHP/

MySQL web platform, agencies can significantly reduce administrative overhead, minimize resource

leakage, and ultimately deliver aid to vulnerable populations with greater speed and precision.
